

Cadence

Your AI-assisted LinkedIn writing system

QUICK START GUIDE FOR CREATORS

Use this guide to understand what Cadence does, how to start it, and how to stay in control while the AI agents research topics, draft posts, and learn your voice.

8

specialist agents
working together

5 min

setup for your voice
and audience

0

posts published
without your approval

What you get

- Weekly topic research based on your content pillars.
- Hook options before a post is written.
- Drafts shaped around your voice, examples, and rules.
- Approval checkpoints before anything moves forward.

START HERE

Set it up in 3 steps

Cadence runs inside Claude Code. You stay in the approval seat from setup through publishing.

1

Open the Cadence folder

Open this project folder in Claude Code so the commands and agents are available.

2

Run `/setup`

Answer the voice, audience, pillar, and writing-sample questions. Cadence builds your personal knowledge base.

3

Run `/run-pipeline`

Let the agents research topics and draft posts. You choose topics, hooks, and final approvals.

The approval rule

Cadence pauses before key decisions: topic selection, hook selection, draft review, and publishing. The system can help you move faster, but it does not remove your judgment.

Pick topics

Choose hooks

Approve drafts

Publish or save

Commands you will use

Keep these four commands handy. Most creators only need the first two to get started.

/setup

One-time onboarding. Teaches Cadence who you are, your audience, your content pillars, and your writing voice.

/run-pipeline

The main weekly workflow. Finds topic ideas, ranks them, drafts posts, and asks for approval at each checkpoint.

/add-writing-sample

Adds a strong post or edited draft back into the system so future posts sound more like you.

/linkedin-manager

Runs a periodic strategy review using your content and analytics so you can improve direction over time.

Simple weekly rhythm

Run the pipeline, make choices at each pause, edit the drafts, save what the system should remember, and repeat next week.

Choose your comfort level

You can start safely and upgrade automation later. Nothing needs API keys on day one.

Default path

Notion

Cadence saves approved posts to Notion. You review and publish manually. Best for most people starting out.

Advanced path

LinkedIn auto-publish

Add your LinkedIn token later if you want direct publishing. Until configured, it stays in dry-run mode.

Manual path

Show me

Drafts stay inside Claude Code. You copy, paste, and post wherever you want.

Later, when you want auto-publishing

Install requirements, copy the example environment file, and add your LinkedIn token and URN. Until those are present, Cadence drafts without posting.

How Cadence improves

The first run is a starting point. Your edits and approvals are what make the system sound like you.

Approve

Choose what works and reject what does not.

Remember

Save edits, banned words, and useful patterns.

Improve

Add posts that perform well as writing samples.

What lives in the folder

- .claude/commands** The commands you type, like /setup and /run-pipeline.
- .claude/agents** The specialist agents Cadence runs automatically.
- knowledge_base** Your profile, voice rules, examples, and inspiration.
- scripts + integrations** Optional LinkedIn publishing support.

Privacy note: your knowledge base stays on your machine.
